Performance Curves

MF

Performance Curves are based on 50 SSU oil entering the cooler 50°F higher than the ambient air temperature used for cooling. This is referred to as a 50°F E.T.D.

Step 1 Determine the Heat Load. Heat load may be expressed as either horsepower or BTU/Hr. To convert horsepower to BTU/Hr.:
BTU/HR = Horsepower x 2545

Step 2 Determine Entering Temperature Difference. The entering oil temperature is generally the maximum desired oil temperature.
Entering oil temperature – Ambient air temperature = E.T.D.

Step 3 Determine the Corrected Heat Dissipation to use the curves.
Corrected Heat Dissipation = BTU/HR heat load x $\frac{50^\circ\text{F} \times C_v}{\text{E.T.D.}}$

Step 4 Enter curves at oil flow through cooler and curve heat dissipation. Any curve above the intersecting point will work.

Step 5 Determine Oil Pressure Drop from Curves:
● = 5 PSI; ■ = 10 PSI; ▲ = 20 PSI. Multiply pressure drop from curve by correction factor found in oil Δ P correction curve.

Oil Temperature

Typical operating temperature ranges are:
Hydraulic Motor Oil 120°F - 180°F
Hydrostatic Drive Oil 160°F - 180°F
Engine Lube Oil 180°F - 200°F
Automatic Transmission Fluid 200°F - 300°F

Thermostatic Temperature Control Option (DC)

This controller was designed to mount on the cooler without requiring extensive wiring or plumbing. It provides accurate temperature control by cycling the cooling fan(s) to maintain desired oil temperature.

- 12 or 24 volt operation
- Adjustable temperature settings range from 100°F thru 210°F in 20°F increments
- For use with one or two fan models
- Temperature sensor provided
- Wiring provided for remote manual override
- Mounting hardware included
